

F.lli Perin S.r.l. has developed a quality and safety policy in order to be more efficient on the market and more efficient within the company itself, by activating a risk mitigation program for workers' safety and health.

The main goal of this policy are:

Client satisfaction

Continuous improvement of internal processes

Risk mitigation program for workers' safety and health

Accordance with applicable laws

The organisation applies and pursues these goals through the following steps:

- Understanding the **clients' need** in order to give the most appropriate solution within the right time, with the highest service level and with the maximum degree of client satisfaction.
- Performing one's job in compliance with applicable laws and rules. When the latter is not available, one will comply with internal standards of **common sense and responsibility**;
- Keeping all company processes, products and received services under constant control, with **monitoring activities** and suitable indicators;
- Performing all duties, from prevention to production, in suitable environments and with suitable equipment, in order to **eliminate or mitigate risks for workers' safety and health**;
- Select and train **our co-workers**, about the goals and the objectives of the company's Quality and Safety Management System;
- Highlighting and encouraging participatory approaches and attitudes from partners and workers in all the "**Culture of Quality and Safety**" activities promoted by the company. Self-accountability is encouraged and all individual initiatives aimed at improvements in this sense are promoted.
- **Controlling and selecting suppliers**, improving the working relationships and choosing the most reliable suppliers.
- Working in **accordance with applicable laws and rules** linked to safety management, setting growing goals in order to make the continuous improvement of performances more effective.
- **Handling non-compliant elements** and applying the necessary actions in order to improve products and therefore reduce costs and generate higher profits;
- Facing possible safety incidents **rapidly and effectively**, adopting adequate **corrective actions** and understanding the causes of the incidents in greater details;
- Engaging in continuous improvements of the Safety Management System and of its efficacy.
- Conducting periodical **reviews of incidents and risk situations** on safety matters, in general, with the goal of verifying the effectiveness of corrective measures adopted and the progresses made by complying to this policy.

The use of **UNI EN ISO 9001:2015** Quality Management models and of **BS OHSAS 18001: 2007** model for safety are part of the Company Policy

The System Management office is in charge of the Management System for Quality and Safety, its maintenance and updating
